

How to create local and remote git repo

-by Yimou

1. Create a repo in GitHub:

Create a New Repository:

Once you're logged into your GitHub account, click the "+" icon in the top right corner of the screen and select "New repository."

Fill in the repository name, description, and choose other settings. You can either initialize the repository with a README file or leave it empty if you plan to add one later.

Click the "Create repository" button

2. Set Up Git:

In terminal:

```
git config --global user.name "Your Name"  
git config --global user.email "your@email.com"
```

3. Clone the Repository:

In terminal:

```
git clone REPO_URL
```

4. Add a New File & Commit your change

In terminal:

```
git add .  
git commit -m "message you want to declare"  
git push origin main
```

5. Done! :D
